

New advances from PRIMA projects for improving Mediterranean Agro-Food value chains

May 18-19 2023

INIAV, Oeiras, PORTUGAL

18-19 May 2023

Genome analysis and identification of molecular markers for rice (*Oryza sativa*) traceability

M. Beatriz Vieira, Pedro M. Barros, Tiago F. Lourenço & M. Margarida Oliveira

TRACE-RICE with Grant n° 1934, (call 2019, section 1 Agrofood) is part of the PRIMA Programme supported under Horizon 2020, the European Union's Framework Programme for Research and Innovation

itqb nova

The relevance of rice

Rice is the **primary staple food** (> 3.5 billion people)

20% of total calories consumed worldwide

Increase of **relevance in Europe**

Produced in the EU
Mediterranean countries

Rice has rich genetic diversity

Great number of
varieties

With ranges of quality and value

Rice-based foods are prone to **fraud and adulteration**

Fraudulent variety claims

Loss of value for the consumer

Jeopardize value of honest producers

Rice-based foods are prone to **fraud and adulteration**

Develop **tools to identify undesirable mixtures**
and
to **discriminate between varieties**

Molecular markers-based methods are efficient

PCR is relatively **inexpensive**

Whole-genome data is increasing

Develop a **DNA-based method** to **discriminate varieties** that **circulate** on the **European market**

With **minimal associated costs**

Resequencing of 20 rice varieties

Bioinformatic analysis
of resequenced genomes

Identification of polymorphisms
and **design of a functional**
detection method

Whole-genome sequencing of the studied varieties

- Arborio
- Ulisse
- Ronaldo
- Ariete
- Giza 181
- Arelate
- Caravela
- Super Basmati
- Maçarico
- J. Sendra
- Gageron
- Manobi
- Carnaroli
- Elettra
- Teti
- CL-28
- Giza 177
- Albatros
- Lusitano
- Basmati type III

DNA extracted from leaves

Did not germinate
DNA extracted from seed flour

Confirmed DNA quality and concentration

A260/A230 λDNA
A260/A280

Shipped for sequencing

Quality control

Sequencing (Illumina platform)

TruSeq DNA PCR-Free

(Reig-Valiente *et al.* (2016))

**Bioinformatics analysis of
whole-genome sequences**

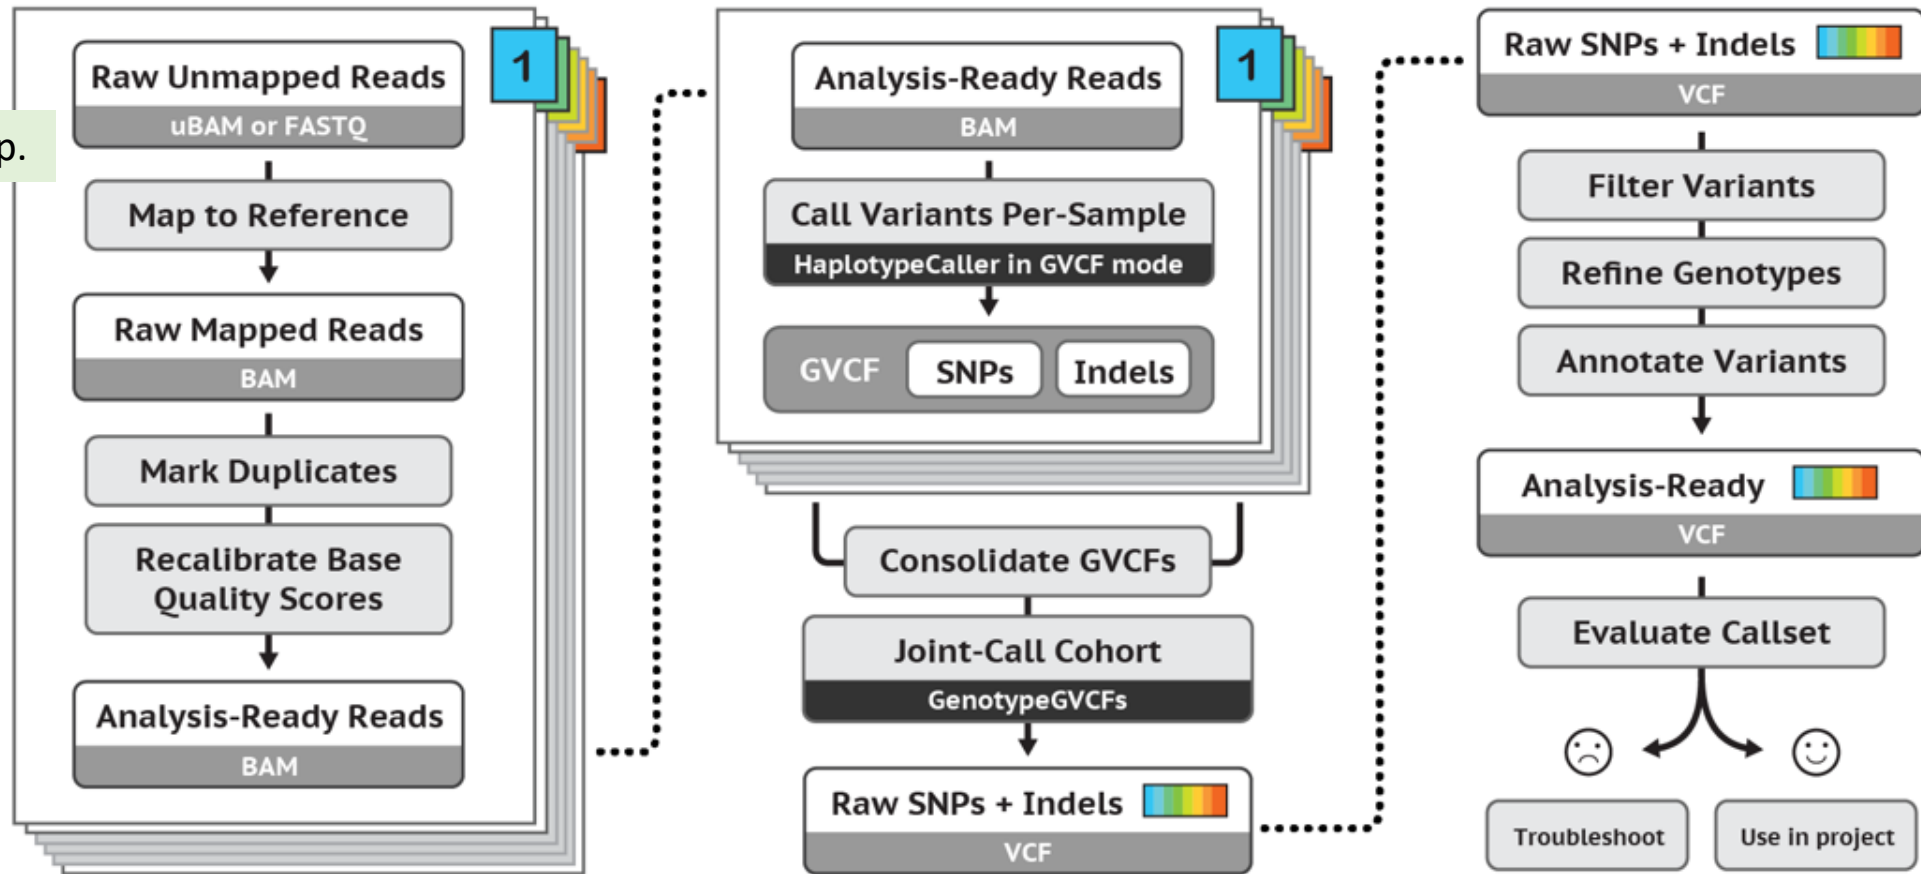

Short variants calling
(identification of polymorphisms)

From reads to variants...

GATK workflow for variants calling

Nipponbare sp.

InDel markers were selected for varietal discrimination

Over 4M variants were extracted from the 22 genotypes

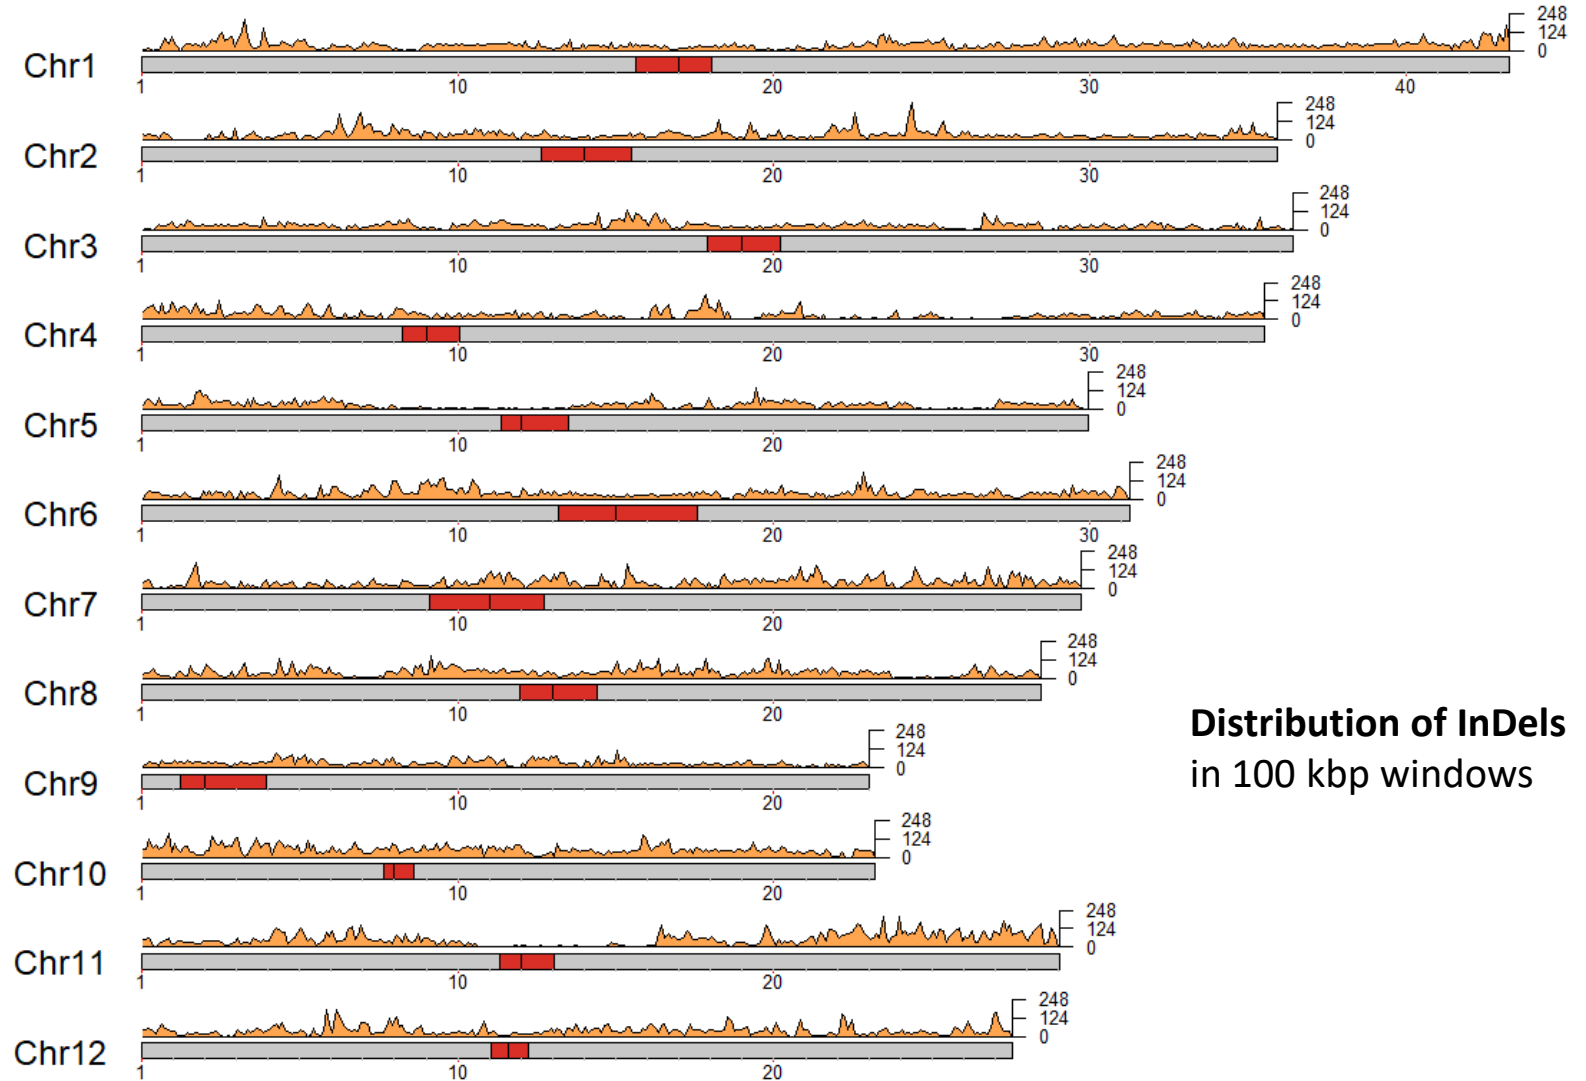

SNPs (3,612,131)

InDels (1,217,118 => 97,576)

>5 bp
MAF > 0.1
Normalized

What are the InDels with enough discriminating potential to identify each and all of the varieties?

Distribution of InDels in 100 kbp windows

The Conditional-Random-Selecting (CRS) method

Yuan *et al.* (2022)

BMC Bioinformatics

RESEARCH

Open Access

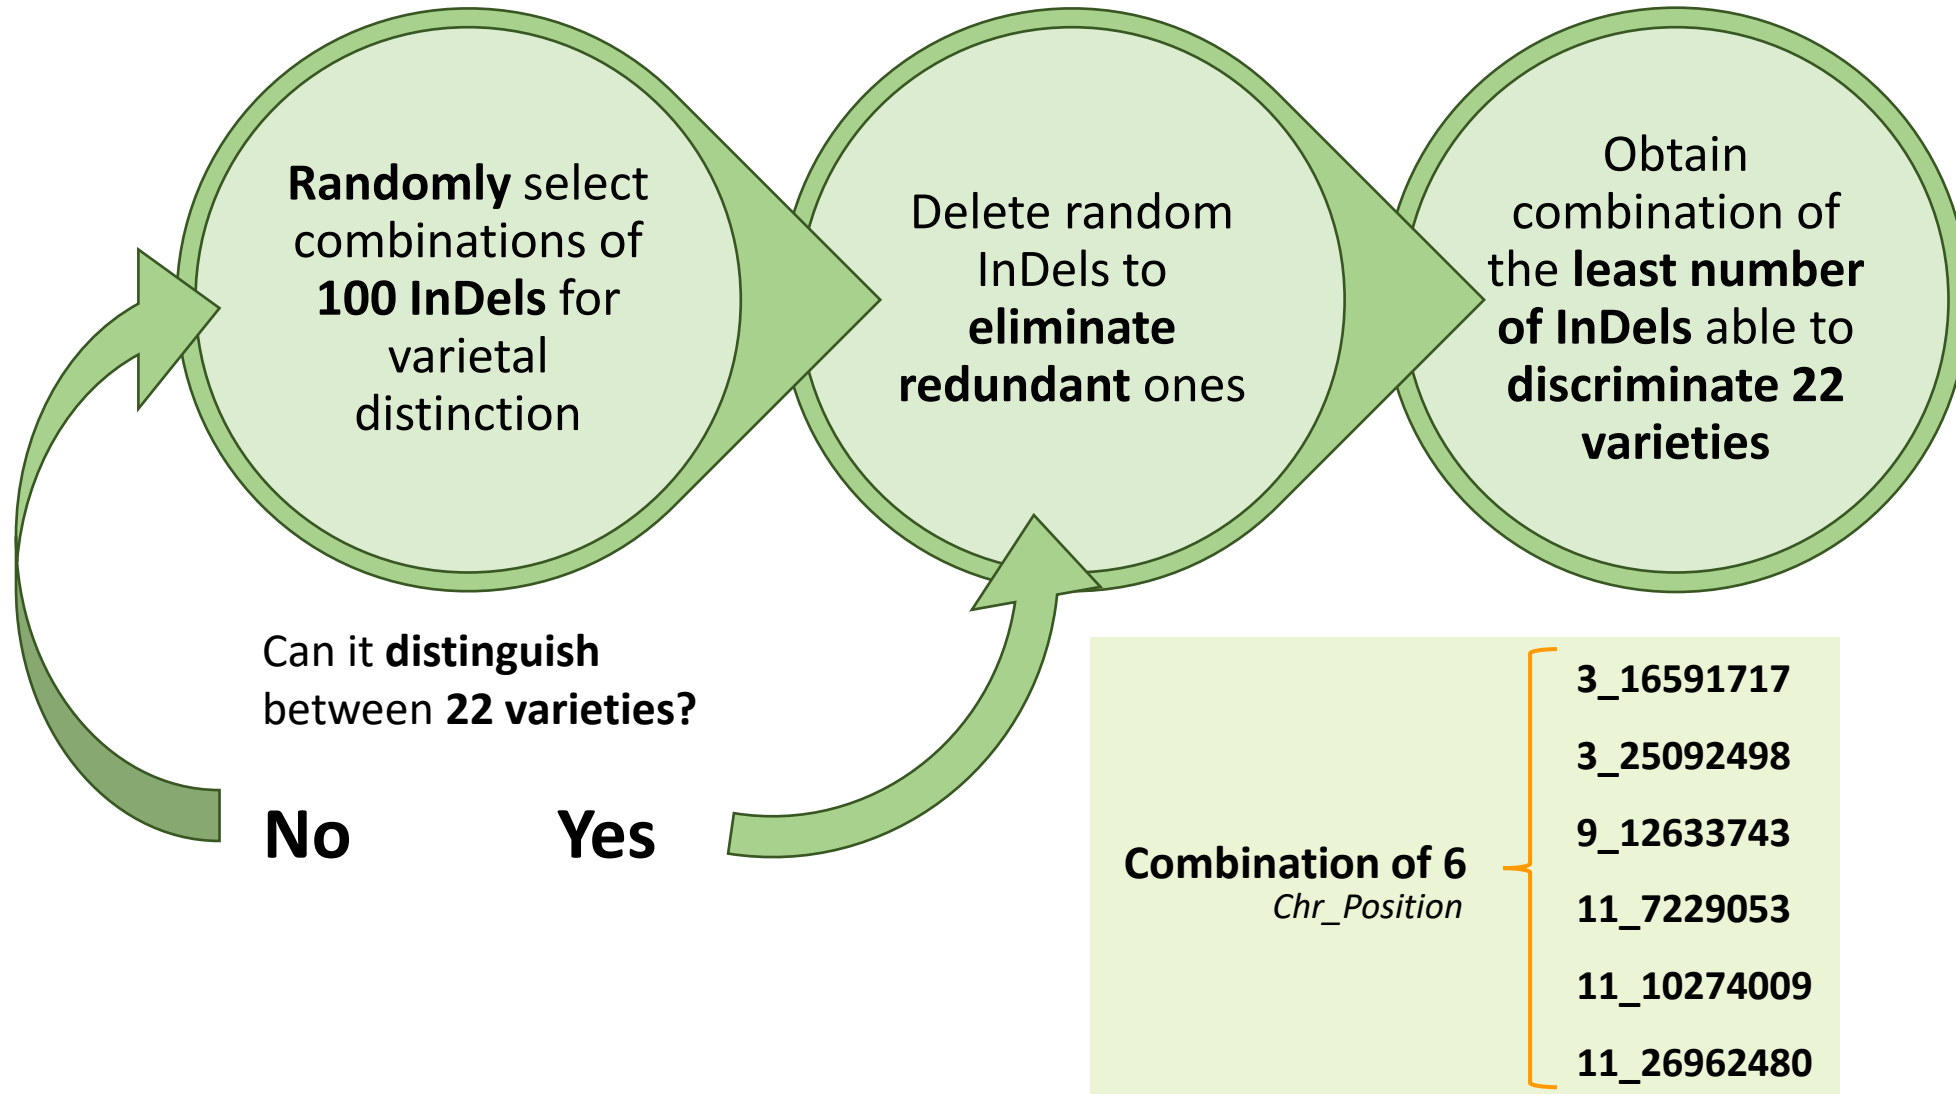

Effective identification of varieties by nucleotide polymorphisms and its application for essentially derived variety identification in rice

Xiong Yuan^{1†}, Zirong Li^{1†}, Liwen Xiong¹, Sufeng Song², Xingfei Zheng³, Zhonghai Tang⁴, Zheming Yuan^{1*} and Lanzhi Li^{1*}

Find the **lowest number of SNPs** that **discriminates** a number of **varieties**
Eliminates redundant SNPs

6 InDels were selected using the CRS method

Predicted results confirm the discriminating potential

Presence vs absence detection

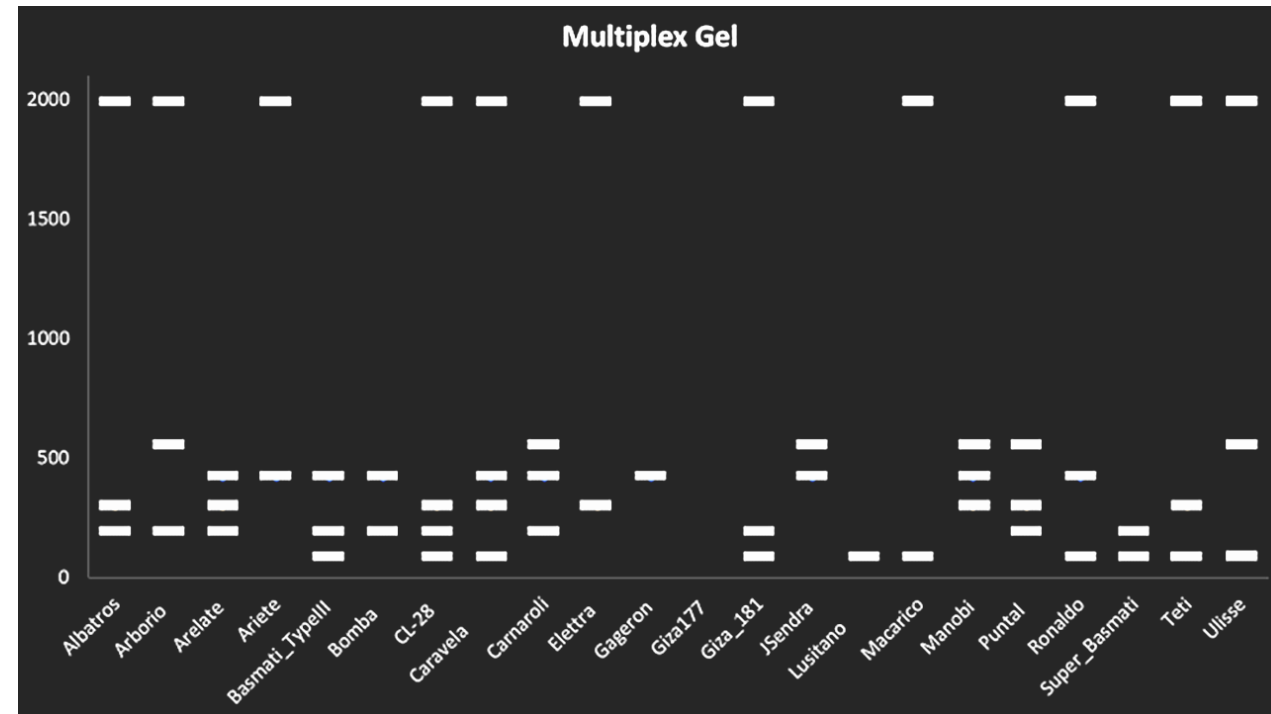

Primer design is complex (many sequence repeats)

Ongoing:

- “Uniplex”-PCR optimization
- Single-seed DNA extraction
- Development of **multiplex system** for **electrophoresis detection**

Predicted results of an electrophoresis gel of the multiplex-PCR products:

Take home message

Outcomes

Obtained and analysed the **whole-genome sequence** of **20 varieties**

Optimized the **CRS method** for **InDels** selection

6 InDels

Ongoing and future perspectives

Experimental validation of the method

Application of **multiplex-PCR** for the InDels detection

Validation of the method to **other sequenced varieties**
